EDA PREP LIBRARY | QUICK START

One-page user guide

Download • Set up • Run both functions • Verify Excel outputs

Author: Nilesh Kulkarni

GitHub: open the EDA Prep Library folder

1 DOWNLOAD & EXTRACT

- Open the GitHub folder link above.
- Click the repository's green Code button → Download ZIP (at the repository level).
- Extract the ZIP, then open: Data_Analytics-main / EDA Prep Library.
- Confirm that pyproject.toml, README.md and the edapreplib folder are present.

2 SET UP PYTHON

Open Command Prompt or PowerShell in the EDA Prep Library folder. Python 3.10+ is recommended.

```
python -m venv .venv
.venv\Scripts\activate
python -m pip install -e .
```

If installation fails, check the error message and confirm the terminal is in the folder containing pyproject.toml.

3 PREPARE A TEST

- Copy a test CSV into this same folder (example: Customer_Churn_Imbalance_96pct.csv).
- Create main.py in this folder. Update the CSV filename and target column to match your data.
- For the example below, the CSV must contain a column named Churn.

4 CALL BOTH FUNCTIONS

```
import pandas as pd
from edapreplib import (
    generate_eda_report,
    assess_ml_readiness
)

df = pd.read_csv(
    'Customer_Churn_Imbalance_96pct.csv'
)

generate_eda_report(
    df, filename='EDA_Report.xlsx',
    plots=True, separate_sheets=True
)

results = assess_ml_readiness(
    df, target='Churn',
    task='classification',
    output_file='ML_Readiness_Report.xlsx'
)

print(results['summary'].to_string(index=False))
```

5 RUN & CHECK THE RESULTS

In the same terminal, run:

```
python main.py
```

Expected output files

- EDA_Report.xlsx — profile, statistics and optional plots.
- ML_Readiness_Report.xlsx — preliminary readiness findings.

Open the workbooks and inspect the sheets, counts, plots and warnings. The exact report contents depend on your package version and input data.

QUICK TROUBLESHOOTING

ModuleNotFoundError: edapreplib	Activate the virtual environment; run pip install -e . from the folder with pyproject.toml.
ImportError for assess_ml_readiness	Check that edapreplib/ml_readyness.py contains the function and __init__.py imports it.
FileNotFoundError	Check the CSV spelling and confirm it is in the current working folder.
KeyError: 'Churn'	Change target='Churn' to the exact target-column name in your CSV.
